For External Application

# NATURASEPT JOINT FLEX Gel

The movements of the body and its parts take place with the participation of bones that play the role of levers, and skeletal muscles, which together with the bones and their joints form the locomotor system. Bones and their joints are a passive part of the musculoskeletal system, and the muscles that contract, change the position of the bones – its active part.

In the human skeleton, the bones are joined together by joints, which are constructed from cartilaginous, bone and connective tissue. For the full functioning of the joint, constant nutritional support is important, since these tissues are characterized by high metabolic rate in them.

The combination of chondroprotectors with anti-inflammatory plant substances provides not only a preventive effect, but also helps to reduce the intensity and severity of chronic inflammation in the joint. Such an advantage of the ingredient composition is characteristic for the **"NATURASEPT JOINT FLEX Gel"**
